Trifork Developer Test

Using the [Github REST Api v3](#) or [Github Api v4 with GraphQL](#) build the following functionalities using the programming language and technologies of your choice:

1. Given an organization return the number of repositories.

2. Given an organization return the biggest repository (in bytes).

3. Return the number of organizations that are currently on Github.

You are free to use any technology that you may think is convenient to solve this problem. You should **include a brief documentation on how to use** or test your solution.

Don't forget to showcase what you do best 🙂 .
